The generation gap between parents and children is not new but has become noticeable in recent decades. In the era of digital technology developing at a rapid pace, just a new step in a smart product or application is enough to push two generations apart. Parents and children today often do not have much time to share and confide together. Although parents love their children very much, they have little time to listen and talk. The workload is too much and the stress, until the evening, either they have too little time, or they are too tired to play with their children. Having little time to interact with children will make it impossible for parents to fully understand what their children are thinking, and in retrospect, the gap between the two generations is too far to be resolved with a few conversations. quick story.

Animal research has played an important role in many of the scientific and medical advances of the last century and continues to aid our understanding of various diseases. Around the world, people enjoy a better quality of life thanks to these advances and the subsequent development of new drugs and treatments — all made possible by animal research. Animals are good research subjects for a variety of reasons. They are biologically similar to humans and susceptible to many of the same health problems. It is not surprising that general practitioners (general practitioners) are even more aware of the contributions that animal research has made and continues to make to human health. The benefits of animal research are immense and it will have serious consequences for public health and medical research if it is abandoned.
